

Classical Field Theory

Classical Field Theory

Lecture Notes

Fields, symmetries, variational
principles, and physical laws.

June 14, 2026

Contents

1	Fields, Locality, and Continuous Degrees of Freedom	2
1.1	What Is a Field?	2
1.2	Scalar, Vector, and Tensor Fields	2
1.3	Space-Time Dependence and Field Domains	2
1.4	Locality, Sources, and Field Response	2
1.5	Degrees of Freedom in Continuous Systems	2
1.6	From Discrete Oscillators to Continuous Media	2
1.7	Basic Physical Examples of Fields	2
2	Action Principles: From Particles to Fields	3
2.1	Action as a Functional	3
2.2	Variations of Particle Trajectories	3
2.3	Boundary Conditions in Variational Problems	3
2.4	Euler–Lagrange Equations in Mechanics	3
2.5	Generalized Coordinates and Constraints	3
2.6	Integration by Parts and Boundary Terms	3
2.7	Worked Particle Models	3
3	Lagrangian Field Theory and Field Equations	4
3.1	Lagrangian Density and Field Action	4
3.2	Variation of Fields	4
3.3	Euler–Lagrange Field Equations	4
3.4	Multiple Fields and Coupled Equations	4
3.5	Boundary Terms in Spacetime	4
3.6	The Wave Equation from an Action	4
3.7	Laplace and Poisson Equations	4
3.8	Fields with Potentials and Interactions	4
4	Spacetime, Lorentz Symmetry, and Covariant Notation	5
4.1	Minkowski Spacetime and Events	5
4.2	Spacetime Interval and Metric	5
4.3	Four-Vectors and Covectors	5
4.4	Index Notation and Contractions	5
4.5	Lorentz Transformations	5
4.6	Four-Derivatives and the d’Alembert Operator	5
4.7	Relativistic Invariants	5
4.8	Sign Conventions and Units	5
5	The Real Scalar Field	6
5.1	The Free Real Scalar Field	6
5.2	Massless and Massive Field Equations	6
5.3	Plane-Wave Solutions	6
5.4	Dispersion Relations	6
5.5	Energy and Momentum of Scalar Fields	6
5.6	Interacting Scalar Fields and Potentials	6
5.7	Linearization and Small Perturbations	6
5.8	Stability and Boundary-Value Problems	6

6	Symmetries, Currents, and Noether's Theorem	7
6.1	Continuous Transformations	7
6.2	Global and Internal Symmetries	7
6.3	Variation of the Action under a Symmetry	7
6.4	Noether's Theorem for Fields	7
6.5	Conserved Currents and Charges	7
6.6	Translation Symmetry and Energy-Momentum	7
6.7	Rotational and Lorentz Symmetry	7
6.8	Complex Scalar Field and Global Phase Symmetry	7
7	Electromagnetic Potentials and Gauge Freedom	8
7.1	Scalar and Vector Potentials	8
7.2	Electric and Magnetic Fields from Potentials	8
7.3	Gauge Transformations	8
7.4	The Four-Potential	8
7.5	The Electromagnetic Field Tensor	8
7.6	Electric and Magnetic Components of the Field Tensor	8
7.7	Field Invariants	8
7.8	Homogeneous Maxwell Equations	8
8	Maxwell Theory from an Action	9
8.1	Electromagnetic Lagrangian Density	9
8.2	Coupling to Sources	9
8.3	Variation with Respect to the Four-Potential	9
8.4	Inhomogeneous Maxwell Equations	9
8.5	Charge Conservation and Gauge Invariance	9
8.6	Lorenz Gauge and Wave Equations	9
8.7	Action for a Charged Particle	9
8.8	Lorentz Force from Variation	9
9	Energy, Momentum, and Stress in Field Theory	10
9.1	Canonical Field Momentum	10
9.2	Hamiltonian Density	10
9.3	Canonical Energy-Momentum Tensor	10
9.4	Symmetric Energy-Momentum Tensor	10
9.5	Scalar-Field Energy and Momentum	10
9.6	Electromagnetic Energy-Momentum Tensor	10
9.7	Poynting Vector and Energy Flux	10
9.8	Maxwell Stress Tensor and Radiation Pressure	10
9.9	Local Conservation Laws	10
10	Green Functions, Sources, and Field Propagation	11
10.1	Linear Field Operators	11
10.2	Definition and Interpretation of Green Functions	11
10.3	Point Sources and Distributions	11
10.4	Green Function for the Poisson Equation	11
10.5	Green Functions for Wave Equations	11
10.6	Retarded and Advanced Solutions	11
10.7	Causality and Signal Propagation	11
10.8	Retarded Potentials	11
10.9	Distributed Sources and Superposition	11

11 Radiation from Time-Dependent Sources	12
11.1 Near Fields and Radiation Fields	12
11.2 Multipole Expansion for Radiation	12
11.3 Electric Dipole Radiation	12
11.4 Liénard–Wiechert Potentials	12
11.5 Radiation from Accelerated Charges	12
11.6 Angular Distribution of Radiation	12
11.7 Radiated Power and the Larmor Formula	12
11.8 Energy Balance and Poynting Flux	12
12 Gauge Fields and Gravity: The Geometric Outlook	13
12.1 Electromagnetism as a U(1) Gauge Theory	13
12.2 Connections as Gauge Potentials	13
12.3 Curvature as Field Strength	13
12.4 Covariant Derivatives	13
12.5 Non-Abelian Gauge Fields	13
12.6 The Metric as a Dynamical Field	13
12.7 The Einstein–Hilbert Action	13
12.8 The Weak-Field Limit of Gravity	13
12.9 Comparing Electromagnetism and Gravity	13
12.10 Further Directions	13

Chapter 1

Fields, Locality, and Continuous Degrees of Freedom

1.1 What Is a Field?

1.2 Scalar, Vector, and Tensor Fields

1.3 Space-Time Dependence and Field Domains

1.4 Locality, Sources, and Field Response

1.5 Degrees of Freedom in Continuous Systems

1.6 From Discrete Oscillators to Continuous Media

1.7 Basic Physical Examples of Fields

Chapter 2

Action Principles: From Particles to Fields

2.1 Action as a Functional

2.2 Variations of Particle Trajectories

2.3 Boundary Conditions in Variational Problems

2.4 Euler–Lagrange Equations in Mechanics

2.5 Generalized Coordinates and Constraints

2.6 Integration by Parts and Boundary Terms

2.7 Worked Particle Models

Chapter 3

Lagrangian Field Theory and Field Equations

3.1 Lagrangian Density and Field Action

3.2 Variation of Fields

3.3 Euler–Lagrange Field Equations

3.4 Multiple Fields and Coupled Equations

3.5 Boundary Terms in Spacetime

3.6 The Wave Equation from an Action

3.7 Laplace and Poisson Equations

3.8 Fields with Potentials and Interactions

Chapter 4

Spacetime, Lorentz Symmetry, and Covariant Notation

4.1 Minkowski Spacetime and Events

4.2 Spacetime Interval and Metric

4.3 Four-Vectors and Covectors

4.4 Index Notation and Contractions

4.5 Lorentz Transformations

4.6 Four-Derivatives and the d'Alembert Operator

4.7 Relativistic Invariants

4.8 Sign Conventions and Units

Chapter 5

The Real Scalar Field

- 5.1 The Free Real Scalar Field
- 5.2 Massless and Massive Field Equations
- 5.3 Plane-Wave Solutions
- 5.4 Dispersion Relations
- 5.5 Energy and Momentum of Scalar Fields
- 5.6 Interacting Scalar Fields and Potentials
- 5.7 Linearization and Small Perturbations
- 5.8 Stability and Boundary-Value Problems

Chapter 6

Symmetries, Currents, and Noether's Theorem

6.1 Continuous Transformations

6.2 Global and Internal Symmetries

6.3 Variation of the Action under a Symmetry

6.4 Noether's Theorem for Fields

6.5 Conserved Currents and Charges

6.6 Translation Symmetry and Energy-Momentum

6.7 Rotational and Lorentz Symmetry

6.8 Complex Scalar Field and Global Phase Symmetry

Chapter 7

Electromagnetic Potentials and Gauge Freedom

7.1 Scalar and Vector Potentials

7.2 Electric and Magnetic Fields from Potentials

7.3 Gauge Transformations

7.4 The Four-Potential

7.5 The Electromagnetic Field Tensor

7.6 Electric and Magnetic Components of the Field Tensor

7.7 Field Invariants

7.8 Homogeneous Maxwell Equations

Chapter 8

Maxwell Theory from an Action

- 8.1 Electromagnetic Lagrangian Density
- 8.2 Coupling to Sources
- 8.3 Variation with Respect to the Four-Potential
- 8.4 Inhomogeneous Maxwell Equations
- 8.5 Charge Conservation and Gauge Invariance
- 8.6 Lorenz Gauge and Wave Equations
- 8.7 Action for a Charged Particle
- 8.8 Lorentz Force from Variation

Chapter 9

Energy, Momentum, and Stress in Field Theory

9.1 Canonical Field Momentum

9.2 Hamiltonian Density

9.3 Canonical Energy-Momentum Tensor

9.4 Symmetric Energy-Momentum Tensor

9.5 Scalar-Field Energy and Momentum

9.6 Electromagnetic Energy-Momentum Tensor

9.7 Poynting Vector and Energy Flux

9.8 Maxwell Stress Tensor and Radiation Pressure

9.9 Local Conservation Laws

Chapter 10

Green Functions, Sources, and Field Propagation

10.1 Linear Field Operators

10.2 Definition and Interpretation of Green Functions

10.3 Point Sources and Distributions

10.4 Green Function for the Poisson Equation

10.5 Green Functions for Wave Equations

10.6 Retarded and Advanced Solutions

10.7 Causality and Signal Propagation

10.8 Retarded Potentials

10.9 Distributed Sources and Superposition

Chapter 11

Radiation from Time-Dependent Sources

- 11.1 Near Fields and Radiation Fields
- 11.2 Multipole Expansion for Radiation
- 11.3 Electric Dipole Radiation
- 11.4 Liénard–Wiechert Potentials
- 11.5 Radiation from Accelerated Charges
- 11.6 Angular Distribution of Radiation
- 11.7 Radiated Power and the Larmor Formula
- 11.8 Energy Balance and Poynting Flux

Chapter 12

Gauge Fields and Gravity: The Geometric Outlook

12.1 Electromagnetism as a $U(1)$ Gauge Theory

12.2 Connections as Gauge Potentials

12.3 Curvature as Field Strength

12.4 Covariant Derivatives

12.5 Non-Abelian Gauge Fields

12.6 The Metric as a Dynamical Field

12.7 The Einstein–Hilbert Action

12.8 The Weak-Field Limit of Gravity

12.9 Comparing Electromagnetism and Gravity

12.10 Further Directions
