

Basic Mathematics

Lecture 0: Introduction

Damian Chorażkiewicz

What is this course about?

structure space change

Not only formulas

formula

$\neq$

idea

rule

$\neq$

reason

answer

$\neq$

interpretation

Mathematics starts when we ask: **why?**

A mathematical object

First identify the object. Then choose the method.

Three languages

Linear algebra

$$Ax = b$$

vectors, matrices, systems

Analytic geometry

$$ax + by + c = 0$$

lines, planes, distance

Calculus

$$f'(x), \quad \int_a^b f(x) dx$$

change and accumulation

What should we ask?

- What is known?
- What is unknown?
- What is fixed?
- What can vary?
- What is the object?
- What is the structure?
- Which step is allowed?
- What does the result mean?

A problem is not only an answer

One idea, many forms

algebraic $\longleftrightarrow$ geometric $\longleftrightarrow$ conceptual

$$2x + 3 = 7$$

balance
transformation

Slides

map of the lecture
ideas, formulas, examples

Notes

full explanations
definitions, details, reasoning

Learn from the notes. Use slides to follow the lecture.

- Matrices
- Determinants
- Matrix inversion
- Systems of linear equations
- Vectors and coordinates
- Lines and planes
- Sequences and functions
- Limits and continuity
- Derivatives
- Integrals
- Applications of calculus
- Problem sets

Ask good questions.

Then compute.
